

Comments:

Above is the burndown chart representing our group's progress of work over sprint 4. First of all, Trello said that we have 42 points remaining at the completion of our sprint. However, we only had one item remaining in the sprint backlog which was worth 5 points so this was very odd. We couldn't manage to get Trello to make it correctly, and that explains the very strange spike on the graph for the last day.

Through this sprint, we did an alright job with making sure that things didn't get left to the last minute. We started earlier than we did for the other sprints and this was because we had less busy schedules for this sprint. Around the 15th and 16th of November there is a bit of stagnation and that's attributed to having the term test to prepare for.

Velocity Comparison:

In this sprint, our planned velocity was 79 points compared to 62 from Sprint 3. The reason for this was mainly because this was the final sprint. All the features that we were hoping to implement needed to be completed this sprint, and because of that, our velocity was higher than it was for Sprint 3. Also, as mentioned, our schedules over the duration of this sprint were a bit lighter than last sprint so we intentionally planned to take on a bit more this sprint.
